## **Education**

#### The Ohio State University

2017 - Current

Ph.D. student in Electrical and Computer Engineering

Thesis: Optimization and Market Design of Transportation Systems

# Nanchang University

2010 - 2016

M.S. in Mechanical Engineering, B.S. in Automotive Engineering

Thesis: Design of a Vehicle Control System for Electric Vehicle based on AUTOSAR

# **Projects**

## Optimization, Pricing, and Learning in the Ridehailing Systems

2017 - Current

- Pricing algorithm in a ride-sharing system
  - Designed a pricing policy that fairly allocates the cost of operation of a ridehailing system with asymmetric elastic demand
  - Demonstrated the robustness of the fair pricing policy under perturbation of the system parameters
- o Reinforcement learning for optimal rebalancing policy
  - Developed a deep reinforcement learning algorithm to optimize the tradeoff between empty vehicle miles traveled and expected passenger waiting time in a ridehailing system
  - Demonstrated through Monte-Carlo simulations that the average empty vehicle miles travelled is reduced by 50% and average customer waiting time is reduced by 36% in comparison to the MaxWeight based rebalancing policy
- o Monte-Carlo Simulator for Multimodal Transportation system
  - Designed a Monte Carlo simulator that computes the key quality of service metrics under different rebalancing algorithms for various modes in a multimodal transportation system
  - Ford Motor Company is considering filing a patent application for this simulator

#### Scheduling, Optimization, and Market Design of EV Charging

2019 - Current

- Scheduling of Charging of EV in a Large Market
  - Designing a linear programming based scheduling algorithm to schedule charging of a large number of EVs in a city
  - Applying approximate dynamic programming with a function approximation for real-time computation and developing optimality and robustness guarantees

#### **Development of Embedded System on EV**

2014 - 2016

- Vehicle Control System
  - Developed a software architecture and multi-level CAN systems based on AUTOSAR that improves the modularity, scalability and re-usability of the vehicle control system
- Battery Management System
  - Designed a Kalman filter based algorithm to reduce the noise in the battery voltage measuring

## **Courses**

- Mathematics: Theory of Probability (I & II), Discrete Stochastic Processes, Probability and Random Variables, Introduction of Real Analysis (I & II)
- o Optimization: Reinforcement Learning, Mathematics of Data Science, Optimization for Static and Dynamic Systems, Game Theory and Mechanism Design
- o Control: Nonlinear Systems Theory, State-Space Control Systems

## **Publications**
